

Security System

The strongest system on the market, with dual redundant networks at all levels and the unique I/NET® Seven architecture.

Establishing a backup operating center could not be easier. In fact, because I/NET Seven is not a client server system, operations can be immediately established wherever the LAN/WAN exists.

Because the system is not client/server, you are free from the dependence of costly clustered servers and disk RAID arrays.

With wide ranging integration and interfaces at all levels of the architecture, I/NET Seven builds the strongest possible security solutions.
